

REVIT ADVANCED TOOLS

**TAKE ADVANTAGE OF ALL THE REVIT
TOOLS THAT CAN SAVE YOU
HOURS OF WORK**

The objective of this course is to help users, who already have a basic knowledge of Revit, to increase their productivity while avoiding tedious tasks. Such as, customising a large number of views, using groups, add phases and phase filters, manage design options to present the client with multiple designs from a single model, and the use of various types of project templates.

Phases

Specify which project elements belong to a specific phase in the process of construction. Create views that show each of these separate phases.

Groups

Sets of elements that can be inserted into a project. Model and annotation groups can be saved externally and then inserted into multiple projects.

Project Templates

Save time and provide consistency in applying office standards when creating similar projects. Templates can include items such as levels, views, sheets, schedules and more.

Design Options

Create several design options for various parts of the building within a single model.

View Templates

Save hours of time setting up the graphics in your views by preparing your own custom view templates to suit your practice.

Transfer Project Standards

Learn how to import materials, view templates, tags, even views and sheets from project to project.
